başka bir shared_ptr nesnesinin göstermesini istiyoruz.

shared_ptr<Member> spm (spowner, spowner->mx);

struct integral_constant {

using value_type = T;

static constexpr T value = v;

using type = integral_constant;

Vartile nederi diger metafinbayanın kalıtın yazıla bundin elde atimat.

constexpr operator value type() const noexcept { return value; }

constexpr value_type operator()() const noexcept { return value; } // since c++14

shared_ptrile hayatı kontrol edilen bir sınıf nesnesinin veri elemanlarından birini

Eğer bir önlem alınmaz ise sahip olan nesneyi gösteren shared_ptr'nin hayatı bitince elemanı gösteren shared_ptr dangling hale gelirdi.

Buradaki problemi çözmek için shared_ptr sınıfının "aliasing ctor" denilen ctor'u ile elemana shared_ptr oluşturuyoruz:

```
using namespace std;
int main()
{
     auto sp = make_shared<Owner>();
     auto spm = shared_ptr<Member>(sp, &sp->mx);
     cout << "spm.use_count() = " << spm.use_count() << "\n"; -> 2
      cout << "sp.use_count() = " << sp.use_count() << "\n"; -> 2
      sp.reset();
      cout << "spm.use_count() = " << spm.use_count() << "\n"; -> 1
      cout << "sp.use_count() = " << sp.use_count() << "\n"; -> \color
      (void)getchar();
      //(void)getchar();
